Abstract

Evolutionists say humans evolved from apelike ancestors 150,000 years ago. But archeological evidence shows humans existed long before that, going back to the beginning of life on earth. This opens up possibilities for alternative accounts of human origins. Evidence suggests humans are composed of not only ordinary matter but also a subtle material mind and a nonmaterial conscious self. It appears that consciousness, rather than matter, is the primal source of everything, including distinct individual conscious selves. We did not evolve up from matter, but instead we have devolved, or come down from pure consciousness.
