

MAN VS MACHINE - DISCOVERING THE UNIQUENESS OF BEING HUMAN

Abhishek Mishra

Department of Chemical Engineering, BITS, Pilani, Rajasthan

Abstract

This essay describes the human being's efforts in the development of modern and intelligent machines and his desire to create human level machine intelligence. Starting from mid-twentieth century, a lot of researchers and scientists have put up their efforts in the development of programs and machines that could reflect human brain, yet they haven't got any fruitful results. Humans, the gift of God to the world are the supreme machines existing today. All the computing resources available today are obsolete in comparable to the processing power of a human brain. The human body itself provided motivation for the invention of a large number of machines. The future might see development of machines that might be similar or superior to humans in terms of intelligence. But it is imprudence to predict the existence of a technology or machine that could be able to model invaluable human aspects like consciousness, emotions, thoughts and will.
