Abstract

In the present article the authors present a quick look of the theistic Sankhya Philosophy from the perspective of modern physics. It has been observed that theistic Sankhya Philosophy has many common features with the fundamental ideas of modern physics, like interconnected world, non-locality, infinite information etc. Over the years extensive research works have been carried out by several researchers on different fundamental areas of modern physics in order to develop a theory of everything. However, this article points out that some of the basic elements described in Sankhya are very far to be comprehended by the tools currently available in modern science.
